Leading engineering performance by Schmidbauer

Green core Inductive Systems is developed for reactors in grid feeding and back dining converters. It is useful for single-phase as well as three-phase applications and can also be used for many several reactor and transformer topologies.

- + High dielectric strength by the use of high grade insulation materials
- + Reducing of the leckages like skin- and proximity-effects
- + Execution in Cu/Al strip or HF litz wire up to 2,500 amps
- + Protection category: up to IP66
- + Cooling concept: natural, forced cooling, water cooling

Linear inductance process

The existing illustration demonstrates the linear course of the inductance process and the saturation point in depending upon the electricity from a reactor developed in according to the **Green core** Inductive Systems.

Highest quality standards for *Green core*-reactors

- + exclusive use of high-quality materials and major manufacturers
- + high-grade plastics
- + magnet wires and impregnation systems in the insulation class H
- + high surge-voltage and insulation strength

We offer a wide range of power quality products

- + commutation reactors
- + regeneration choke
- + boost inductor
- + output choke
- + sine wave filter reactor
- + du/dt-filter
- + motor reactor
- + line rector

- + non-standard and special design also according to your details
- + water-cooled design
- + vacuum block casting compound also with cooling elements
- + integrated temperature monitoring
- + own UL insulation systems for insulation materials class B and F
- + consultation and maintenance servicing for the UL approval of your complete system

Manufactured in according to UR E181051 insulation system

VDE0570-1 (EN61558-1 / IEC 61558-1): safety of transformers, power supply units, etc.

VDE0570-2-20 (EN61558-2-20 / IEC61558-2-20): special requirements for small reactors

Standards

High performance products www

according to customers needs, self-construction and -development

About Schmidbauer

We are an innovative manufacturer of transformers, reactors, inductive components, filter assemblies and customized control systems. As a part of the Schmidbauer group with 200 employees, we develop and manufacture powerful products in the range of electrical engineering.

In order to offer the customer an efficient total product range, the electronical and sheet metal assemblies are available by our business partner, at the same place of location. We offer our customers high-quality solutions due to our technological know-how, our flexible and modern production lines, as well as short distances during the development, within the company group.

Our products

TRANSFORMERS

Transformers in the low voltage range up to 630 kVA. Take a look at our product range. It is worthwhile!

REACTORS

We develop and build all kinds of reactors. The strongest current ripple becomes weak at us.

TOOLBUILDING

From the circuit board to the final product. Subassemblies individually manufactured or automated manufacturing in order to meet your needs.

MEDICAL ENGINEERING

The art to reconcile customer demand, engineering standards, safety and the patient.

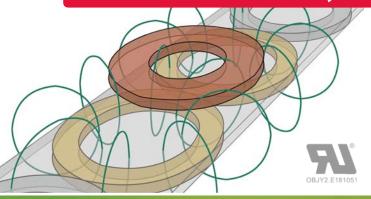

Solutions for e-Mobility

- development of arrangement coils for inductive energy transmutation in the fields of smart grid and e-drive, using in stationary and dynamical systems
- high frequency coils and inductive components for inductive couplings, developed and manufactured in our company
- customized air gaps
- optimized efficient products for inductive couplings in e-mobility
